

I really enjoyed Dennis article in the July newsletter, please forward to him...

I'm building a fake water tower for my small loop for the ombiance setting. I liked the footings, great idea. I planned on doing the same thing for the bands...need to go finish my roof.

I got the same windmill from sam's club for \$85 on closeout, I thought it was mispriced, it wasn't so we grabbed it, but the legs were as warped as can be, along with a few others so it sits in the garage until I rip some better legs for it.

Your engine house looks great, I wanted mine to be more like that, but I have a place to store the cars.

Cant wait to see your station...going to eventually do one of those also...down the road though.

look forward to more info and photos, I'm sure your equipment has been in previous issues, love the proportions, they look great.

Unfortunately I fell about 8' while trimming trees in the backyard and when I landed I busted up my humorous bone in a couple of places, had to have surgery to put three plates and 19 screws. arm is doing good unfortunatly a nerve that controls my hand/wrist/fingers in the up direction got pinched between the break and when they removed it it was intact but bruised really bad so I have had no use of the hand, just waiting and hoping over time it wakes up. in the meantime since I cant put any weight on the arm or use the hand I look what others are doing, and possible projects when things finally come around with the hand.

thanks for sharing your projects.
